Article abstract

A product evaluation was conducted of Desire2Learn, an online learning management system gaining popularity in educational institutions. Since an online trial version of the software was not available for evaluation, an inspection meeting with the vendor was arranged. This provided the evaluation team with an opportunity to examine the precautions necessary for ensuring the objectivity of a product evaluation based on vendor-supplied information. The report outlines the team's use of evaluator-driven enquiry and a triangulated approach to information checking. The Desire2Learn product is assessed as a flexible and useful addition to the range of learning management system options.

Technical Evaluation Report

30. Vendor-Assisted Evaluation of a Learning Management System

Patricia Fahrni, Jim Rudolph, and Adrienne De Schutter

Master's of Distance Education Program

Athabasca University - Canada's Open University

Abstract

A product evaluation was conducted of *Desire2Learn*, an online learning management system gaining popularity in educational institutions. Since an online trial version of the software was not available for evaluation, an inspection meeting with the vendor was arranged. This provided the evaluation team with an opportunity to examine the precautions necessary for ensuring the objectivity of a product evaluation based on vendor-supplied information. The report outlines the team's use of evaluator-driven enquiry and a triangulated approach to information checking. The *Desire2Learn* product is assessed as a flexible and useful addition to the range of learning management system options.

Introduction

A previous report in this series (#25) adopted the convention of grouping course and content management systems under the heading Learning Management System (LMS) to avoid confusion between CMS systems. Proliferation of such acronyms is just one example of the types of confusion currently reigning in this rapidly advancing field. Report #10 in the series described another source of confusion, relating to the lack of objectivity that can arise when software is evaluated with the assistance of its developer/vendor. Often there may be no choice in the matter, when a trial version of the product is not available for inspection. The previous report listed the precautions required when the evaluator is obliged to seek the vendor's assistance in order to gain access to the product. The current study provides a direct example of this situation, in describing an LMS evaluation conducted via a face-to-face demonstration by the vendor in a Vancouver educational institution. The report discusses the precautions taken by the evaluation team in maintaining its objectivity throughout this process, and the outcome of the study.

Methodology

Desire2Learn (D2L) is an integrated online learning management system (LMS), which provides synchronous and asynchronous interaction between students, teachers, and learning content. Such platforms are usually integrated with administrative databases (e.g., commercial products such as *SCT Banner*, *Peoplesoft*, *Datatel*, and *Campus Pipeline*).

Information for possible use in evaluating the product was collected in September and October 2003, from varied sources, including:

- Personal access to existing *D2L* courses
- Interviews with *D2L* users
- An interview with an independent evaluator of *D2L* in a post-secondary institution
- Information on the *D2L* company's website
- Demonstration of the software by a *D2L* representative at a Vancouver educational institution

Prior to the visit to the *D2L* representative by two of the three-member evaluation team, steps were taken to ensure the depth and objectivity of the information that would be obtained. The *caveat emptor* recommendations of Report #10, were followed in this connection. In addition to recognizing the need for independent corroboration of the data collected, the evaluators knew they should request the evidence for unsubstantiated claims and should be prepared, if doubtful of any claims, to challenge the vendor to prove them. Objective technical information was sought, where necessary, to replace merely qualitative product descriptions.

Highlights of the information-gathering process were as follows:

1. The vendor's website provided mission and vision statements, information about external market standards, general information about the product and services, a selective demonstration of features, links to reference sites and adjunct services, and contact information for product representatives.
2. As Fahy (2002) points out in Report #10, "it is not reasonable to expect vendors to supply complete, objective information on their own products." Prior to the meeting with the *D2L* representative, therefore, the evaluators solicited impartial information about the product from individuals in two major post-secondary institutions. One of these institutions has used *D2L* for three years, and is doing so currently. The other institution is in the process of assessing whether to transfer to *D2L* from another LMS platform.
3. During the meeting with the *D2L* representative, the evaluators requested and received a detailed demonstration of specific features of the software in order to verify the qualitative and comparative information provided on the company's website. During the review, they explored several reference sites via the representative's access to them.
4. While the company's website provides technical specifications to externally recognized standards, the face-to-face meeting allowed the team to learn first-hand about the history and evolving functionality of the product. This meeting also provided insight into the organization and management of the company, pricing structures, product support, and software upgrades. At times the discussion with the representative had to be re-focused on the current applications of the product rather than on future development possibilities.
5. The 'forewarned-is-forearmed' approach was considered beneficial, and it is gratifying to report the company responded obligingly to the evaluation team's approach at all times. (In fact, the *D2L* company's reputation for a high level of customer service had already reached us by word-of-mouth before the evaluation was conducted.) The

D2L representative was open and forthcoming, receptive to feedback and committed to our discussion of educational criteria.

Evaluation of *Desire2Learn*

The *D2L* software has a startup cost based on the number of features, the level of integration with existing systems, and the support needs of the institution. The product has the capability to be used as a course-by-course delivery tool, or scaled up to a larger entity such as a province-wide license. Annual licensing costs are based on a flat fee or on a per-student basis. Users are not required to download any software. The company's servers contain all the software to support their LMS platform with the exception of Java, which is used under the license. This minimal use of third-party software enables the company to give flexible responses to clients' requirements. The vendor provides access to a support person per 5000 students covered by the license.

The product is essentially asynchronous in its approach to online collaboration; at the time of the evaluation, it does not contain synchronous tools such as audio, whiteboard, instant polling, and co-browsing. Its asynchronous conferencing tools are flexible for both administrators and users. The licensing approach allows administrators to assign roles across multiple organizations to facilitate a consortium approach. Administrators can create an unlimited number of customized user roles, with specific privileges for instructors and students. *D2L* is XML standard-based, and uses a learning-object repository approach that allows instructors to store content (i.e., pages, graphics and test-item banks, etc.). These objects can be shared across any number of courses or programs. (By contrast, other prominent LMS systems use hard-coded HTML pages uploaded to a specific version of a course.) Administrators can assign students the ability to search for specific course content and discussion threads in the learning-object repository. A context-sensitive help feature provides help on each of the major tools for both developers and students. The software is compliant with leading international course-sharing standards including SCORM and IMS, and meets international standards for access by disabled users. *D2L* databases can be configured to communicate directly with other institutional databases.

The customizable features of *D2L* provide administrators with straightforward means of creating conferences for the members of a class or its sub-groups. Students can be assigned access privileges for system-wide text-chat rooms. Once conferences are created for an individual course, new conferences can easily be created for subsequent offerings of the course. Within a specific course offering, administrators can edit or delete threads, and can control the access privileges of users at different levels, including the right to edit and/ or delete one's own messages. Threaded messages are displayed clearly, and users have control over keyword searches and message sortings by date, topic, and sender. Other options include saving, printing, editing and deleting of postings.

Conclusions

A primary strength of *D2L* is the breadth and adaptability of its features. It is a fully integrated learning management system that has evidently evolved through close relationships between the software developer and educational institutions. Because *D2L* is XML standard-based, it is relatively easy to integrate it with other database systems. The product has a high degree of usability. Its course structure and appearance are easy to manipulate, and administrative control over the usage process is broad and easily specified. Owing to its high degree of flexibility and customizability, the product can take many forms. For this reason, the evaluation team recognized

the vendor's preference for demonstrating its product in person, on an individualized basis rather than via a more generalized online demonstration approach

Acknowledgements

The authors thank Ben Moore of the *Desire2Learn* company for his assistance in providing information about this software product; also Bryan Fair, evaluator of *Desire2Learn* at the British Columbia Institute of Technology.

The next report in the series describes the use of synchronous audio methods in a cross-cultural setting.
